CRP (C-Reactive Protein)-Quantitative

CRP (C-Reactive Protein)-Quantitative *Method: Turbidimetric Immunoassay*	13.0 H	mg/L	< 6

INTERPRETATION

The level of CRP in the blood is normally low.

Increased CRP level:

- A high or increasing amount of CRP in the blood suggests the presence of inflammation but will not identify its location or the cause.
- Suspected bacterial infection—a high CRP level can provide indication that patient has an infection.
- Chronic inflammatory disease—high levels of CRP suggest a flare-up if you have a chronic inflammatory disease or that treatment has not been effective.

If the CRP level is initially elevated and drops, it means that the inflammation or infection is subsiding and/or responding to treatment.

RHEUMATOID FACTOR QUANTITATIVE

RHEUMATOID FACTOR, Quantitative *Method: Turbidimetric Immunoassay*	129.5	0-20

Interpretation

Approximately 85% of patients with Rheumatoid arthritis have detectable RA. It may also be seen in other medical conditions like Sjogren's syndrome and SLE.

*Increased in RA, Chronic hepatitis, chronic viral infections, cirrhosis, infectious mononucleosis, leishmaniasis,Syphilis etc.

*High levels are also seen in inflammatory rheumatic diseases and in various non rheumatic diseases.
